7911. Vascular effects of anticoagulants. M. Gábor and E. Dux 2  
*Acta physiol. Acad. Sci. Hung.*, 1956, 9, 273-281 (Pétriárad. Inst.  
and Pediatrical Clinic., Med. Univ., Szeged, Hungary).—Capillary  
resistance was measured in rats by applying for 5 min. a suction of  
200 mg. Hg. to the depilated skin in the lumbar region and noting  
the time until petechias appeared. Measurements were made before  
and 10 min. after the injection of heparin, glutathione, Germanin,  
Chicago-Blue 6B, Aceto-purpurine 8 B, lanthanum-Cl. All of them  
depressed capillary resistance. Previous administration of Toluidine  
Blue or protamine sulphate antagonised the resistance diminishing  
action of heparin.

2674. GABOR M., SZORÁDY I. and SIPOS K. Orvostud. Egyetem Gyógyszertani Int., Gyermekklin. és Bőr-és Nemibeteg Klin., Szeged. \*Höinger által előidézett capillar permeabilitás változás befolyásolása farmakonokkal. Effects of drugs on thermal changes in capillary permeability KISERL.ORVOSTUD. 1956, 8/2 (121-126) Tables 5

Very wide individual variation in reactivity to thermal stimuli was observed in rat capillaries. A new method was evolved to avoid this difficulty and to make more exact investigation possible. Of the various drugs tested, calcium chloride, haematoxylin and butapyrine were found to have the most effect on the thermally increased capillary permeability. Chlorpyramine had to be given in a near-toxic dose to produce a comparable effect. It appears that antihistaminic action cannot be a decisive factor in the mechanism of the above effect.

Title : The Significance of ACTH and Heparin in Regulating  
Capillary Resistibility.

Orig Pub : Kiserl. orvostud., 1957, 9, No 1, 62-64

Abstract : Heparin did not produce the usually observed decrease of  
capillary resistibility in rats which received ACTH for  
some length of time. Both the ACTH-heparin complex and  
the cortisone-antitropic hormone complex participate  
in regulating capillary resistibility. -- From the  
authors' summary.

"Experimental Thrombocytosis with o-Nitrophenol."

Budapest, Kiserletes Orvostudomány, Vol XIV, No 6, 1962, pp 615-618.

Abstract: [Authors' summary] Summarizing their results the authors state that: 1/ 2,4-dinitrotoluol, nitrotoluol, m-nitrophenol, p-nitrophenol as well as 2,6-dinitrophenol have no influence on the number of thrombocytes in rats, 2/ o-nitrophenol, already in a dose of 1 mg per 100 g elevates the number of thrombocytes, while 5-10 mg per 100 g doses show significant elevation. The effect lasts 5-6 days. 3/ The thrombocyte number of normal rats can be elevated significantly by injecting them with sera obtained from rats treated with o-nitrophenol previously.

TITLE: Effect of synthetic isoflavone derivatives on the uterus of young mice

SOURCE: Kiserletes Orvostudomány, v. 17, no. 2, 1965, 197-199

TOPIC TAGS: mouse, drug effect, biochemistry

ABSTRACT:

The estrogenic effect of some synthetic isoflavone derivatives has been studied on young mice by means of the weight measurement of the uterus. Of the (7,4'-dihydroxy-5,8-dimethoxy isoflavone, 7-hydroxy-5,8,2',4',5'-pentamethoxy isoflavone, 5,7,8,4'-tetrahydroxy isoflavone and 5,6,7-trimethoxy isoflavone) compounds used, the tetrahydroxy derivative was found to be the most effective. The author thanks Jozsef Varady placing the isoflavone derivatives at his disposal. Orig. art. has: 2 figures and 1 table. [JPRS]

TITLE: Influence of panthotenic acid on capillary resistance [This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July 1964]

SOURCE: Academia scientiarum hungaricas. Acta physiologica, v. 26, Supplement, 1965, 66

TOPIC TAGS: rat, blood circulation, physiology, man, vitamin

ABSTRACT: The first part of the experiments was carried out on the shaven back of rats of either sex. Capillary resistance was determined by means of BORBELY's apparatus. In response to suction at a negative pressure of 250 mm Hg for one minute, petechiae appeared. Following the determination of the CR value, the rats were treated

Card 1/2

2

L 15511-66

ACC NR: AT6007476

with panthotenic acid (5 mg/kg, intraperitoneally). Capillary resistance was again determined 3-6 hours after this treatment. The study was considered to be completed when no petechiae appeared after a period of 5 minutes. A significant increase in capillary resistance was achieved in 19 of the 23 animals so treated and no petechiae were visible after 5 minutes. Slight elevations in CR were noted in the other 4 rats as well. In the second part of the experiments, the persistence of the effect was studied in 18 rats. The effect was prolonged in 11 of the animals, present even on the fifth day following the administration of panthotenic acid. Another three animals had a slightly protracted effect. Tests made on 16 small children have likewise shown that panthotenic acid increases CR. [JPRS]

"The Antibacterial Effect of Bioflavonoids. Experiments With Fisetin and Fisetidine."

Budapest, Kiserletes Orvostudomány, Vol XVIII, No 2, Apr 66, pages 203-207.

Abstract: [Authors' Hungarian summary] The antibacterial effect of some compounds belonging into the flavonoid group, fisetin, dihydrofisetin, fisetidine and dihydroquercetin were studied. According to the results, dihydrofistein and dihydroquercetin were ineffective, even in high concentrations, against all the strains tested. Fisetin and fisetidine, on the other hand, have a bacteriostatic and bactericidal effect, in high dilutions, on the growth of *St. albus resistans* and *St. aureus* (Buttle). According to the study, fisetin and fisetidine belong among the most highly effective antibacterial bioflavonoids known today. 3 Hungarian, 14 Western references. [Manuscript received 18 Jun 65.]

"Investigation of the Concentration of Carbohydrate Bound with Serum- and  
Lymph-Proteins in Experimental Inflammations"

Budapest, Orvosi Hetilap, Vol 107, No 24, 26 Jun 1966, pp 1203-1206.

Abstract: The protein-sugar level and the concentration of carbohydrate bound  
with the protein of the ductus thoracicus showed an increase in animals experi-  
mentally subjected to turpentine inflammation. On the other hand, the glyco-  
protein content in the truncus cervicalis from the inflamed area was signifi-  
cantly lower, even after 24 or 48 hours, than in the serum or in the ductus  
thoracicus. It was assumed that the organism retains glycoproteins in the  
inflamed areas for use in the regeneration processes. 28 references, including

Title : On the Origin of "Antepartum" Cells. (Reaction of Uropoietic Epithelium to Hormones).

Orig Pub : Magyar noorv. lapja, 1955, 18, No 2, 121-127.

Abstract : The exfoliated cells of the surface epithelium of uropoietic system in the stillborn females corresponded to "antepartum" cells in the mother's urine. It is believed that abundant exfoliation of the epithelium was caused by simultaneous secretions of progesterone, gonadotropic hormone and the folliculin.

A full time newly born infant boy (weight 2650 g., body length 48 cm.) was born in  
a state of asphyxia and could not be revived. Macro- and microscopic examinations  
revealed an acute diffuse catarrhal bronchopneumonia, severe purulent bronchitis  
and bronchiolitis. No doubt the infection occurred in utero, as the mother, at the  
termination of pregnancy had been feverish with evidence of an infection.

✓ Application of complex borohydrides in organic syntheses. János Kollonitsch, Oszkár Fuchs, Valéria Gábor, and Jenő Galambay. (Gyógyszeripari Kutató Intézet, Budapest). *Vegyipari Kutató Intézet Közleményei* 8, 147-52 (1964).— It was observed that LiBH<sub>4</sub> is stable at low temp. (3-4 hrs. at 10°). Its EtOH soln. was prepd. by cooling with an ice-

3 may

salt mixt. separate solns. of NaBH<sub>4</sub> and LiCl in EtOH, mixing the two solns., and filtering off the NaCl. This soln. was found suitable for reducing ketones and aldehydes, including steroidal ketones. New complex borohydrides such as Mg(BH<sub>4</sub>)<sub>2</sub> (from MgMe<sub>2</sub> and diborane in abs. ether) and Ca(BH<sub>4</sub>)<sub>2</sub> were also prepd. in a similar manner. They were found suitable for the selective reduction of various compds., both org. and inorg. They are cheap and relatively easy to prepare. Na methoxyborohydride (cf. Brown, *et al.*, *C.A.* 47, 3741e) was found suitable for the selective reduction of aldehydes, ketones, and acid chlorides. G. J. Ernyet-

GABOR, V.

✓ Chloramphenicol series. I. A new synthesis of chloramphenicol. János Kollonitsch, A. Heide, V. Gábor, and M. Kráti (Research Inst. Pharm. Ind., Budapest). *Acta Chim. Acad. Sci. Hung.* 5, 13-22 (1954) (in German) (English summary).—A new method is reported for the PbO-catalyzed addn. of alkyl hypobromites to a double bond. To a suspension of 12 g. PbO in 100 ml. MeOH is added, alternately and in small portions, 5.2 ml. Br and a soln. of 14.8 g. PhCH:CHCO<sub>2</sub>H in 250 ml. MeOH, the mixt. cooled, stirred 1.5 hrs., and filtered. Removal of Pb salts with H<sub>2</sub>S and concn. in vacuum gives 24.0 g. erythro-2-bromo-3-phenyl-3-methoxypropionic acid (I), m. 170-85°. A suspension of 24 g. PbO in 200 ml. MeOH treated similarly with 10.4 ml. Br and with a soln. of 32.4 g. PhCH:CHCO<sub>2</sub>Me gives, after removal of Pb salts and vacuum concn., 41 g. Me erythro-2-bromo-3-phenyl-3-methoxypropionate (II), m. 74-6°. Heating 82 g. threo-MeOCH<sub>2</sub>PhCH:CHCO<sub>2</sub>H in a sealed tube at 80° for 12 hrs. with 800 ml. concd. NH<sub>4</sub>OH gives 42.18 g. threo-2-amino-3-phenyl-3-methoxypropionic acid (III), m. 228-39° (from alc.). Heating 20 g. I with 170 ml. concd. NH<sub>4</sub>OH for 18 hrs. at 80° in a sealed tube gives 17.45 g. erythro-2-amino-3-phenyl-3-methoxypropionic acid (IV), m. 248-60° (from alc.). Heating 78.5 g. IV with 78.5 g. o-C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H 15 min. at 160° gives 78 g. erythro-2-phthalimido-3-phenyl-3-methoxypropionic acid (V), m. 200-3° (from alc.). Heating 78 g. V with 70 g. PCl<sub>5</sub> in 800 ml. abs. C<sub>6</sub>H<sub>6</sub> gives 73.0 g. erythro-2-phthalimido-3-phenyl-3-methoxypropionyl chloride (VI), m. 195-6° (decompn.). Heating 5 g. VI with 6 ml. abs. pyridine and MeSH (from 20 g. MeSCl; NH<sub>4</sub>OH) and 30 ml. 6N NaOH in a sealed tube gives 2.58 g. erythro-2-phthalimido-3-phenyl-3-methoxypropionic acid methylthiol ester (VII), m. 147-60°

CH

(from alc.). Heating a soln. of 0.45 g. VII in 50 ml. abs. alc. with 4 g. Raney Ni under N gives 0.08 g. product, C<sub>17</sub>H<sub>17</sub>O<sub>2</sub>N (VIII), m. 165-70° (from alc.). To a suspension of 19.45 g. Pd-BaSO<sub>4</sub> in 400 ml. xylene is added 23.9 g. VI and 0.08 g. NH<sub>4</sub>CSNH<sub>2</sub> and the mixt. treated with H<sub>2</sub> at 150°, giving erythro-2-phthalimido-3-phenyl-3-methoxypropionaldehyde (IX), m. 140-42°; p-nitrophenylhydrazones (X), m. 202-4°. A soln. of 25 g. IX in 250 ml. iso-PrOH heated with 13.1 g. Al(iso-PrO)<sub>3</sub> gives 20.18 g. erythro-1-phenyl-1-methoxy-2-phthalimido-3-hydroxypropane (XI), white crystals, m. 104-8° (from Et<sub>2</sub>O). A soln. of 5 g. XI in 20 ml. abs. alc. treated with 30 cc. N alc. soln. N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O gives 2.0 g. erythro-1-phenyl-1-methoxy-2-amino-3-hydroxypropane (XII), green oil; p-nitrobenzoate (vide infra), m. 163-4°. Refluxing 3.35 g. IV with 80 ml. abs. alc. gives 4 g. Et erythro-2-amino-3-phenyl-3-methoxypropionate-HCl (XIII), m. 168° (decompn.). A soln. of 2.63 g. XIII in 7 ml. MeOH treated with a soln. of 0.23 g. Na in 5 ml. MeOH gives 2.31 g. Et erythro-2-amino-3-phenyl-3-methoxypropionate (XIV), as an oil. A soln. of 0.3 g. XIV in 100 ml. dry Et<sub>2</sub>O treated with 1.57 g. LiAlH<sub>4</sub> in 67 ml. dry Et<sub>2</sub>O gives 5.85 g. erythro-1-phenyl-1-methoxy-2-amino-3-hydroxypropane (XV) as an oil. A soln. of 0.2 g. XV in 10 ml. H<sub>2</sub>O treated with 0.22 g. p-C<sub>6</sub>H<sub>4</sub>NC(=O)Cl in 10 ml. dry Et<sub>2</sub>O and 4 ml. N NaOH gives 0.13 g. product which recrystl. from 60% alc. gives 0.08 g. N-p-nitrobenzoyl deriv. of XV, m. 163-4°. Heating 0.84 g. XV with 5 ml. 56% HBr gives 1.13 g. of oil threo-1-phenyl-2-amino-1,3-dihydroxypropane (XVI). A soln. of 0.2 g. of XVI in 6 ml. H<sub>2</sub>O treated with a soln. of 0.11 g. p-O<sub>2</sub>NC(=O)Cl in 10 ml. Et<sub>2</sub>O and with 4 ml. N NaOH gives 0.05 g. N-p-nitrobenzoyl deriv. of XVI, m. and mixed m.p. 194° (from abs. alc.). A soln. of 11.3 g. XI in 20 ml. abs. pyridine treated with H

11  
7/15/57

(5)

JAMES

ml. Ac<sub>2</sub>O gives 12.6 g. (100%) XI acetate (XVII), m. 107-10°. Treatment of 32.5 ml. concd. HNO<sub>3</sub> (decolorized with NH<sub>4</sub>SO<sub>4</sub>) with 12.01 g. XVII, added in small portions, gives 5.19 g. erythro-1-*p*-nitrophenyl-1-methoxy-3-phthalimido-3-acetoxypropane (XVIII), m. 143-4° (from abs. alc.). Heating 1.4 g. XVIII 12 hrs. with 28 ml. 5*N* HCl gives 0.61 g. erythro-1-*p*-nitrophenyl-1-methoxy-2-amino-3-hydroxy-

propane (XIX), rose-red crystals, m. 110° (from CH<sub>2</sub>). Treatment of 0.2 g. XIX with 2 ml. 56% HBr and 5 ml. H<sub>2</sub>O followed by extn. with EtOAc and treatment of the ext. with 1 ml. Ac<sub>2</sub>O and 1 ml. pyridine gives 0.11 g. erythro-1-*p*-nitrophenyl-2-acetamido-1,3-dihydroxypropane diacetate (XX). u. and mixed m.p. 154-8° (from Et<sub>2</sub>O). Refluxing 120 ml. of satd. alc. HCl with 47.87 g. III and continued addn. of HCl gas gives 40.25 g. Et threo-2-amino-3-phenyl-3-methoxypropionate-HCl (XXI), m. 183-4°. A soln. of 40.25 g. XXI in 150 ml. abs. MeOH treated with a soln. of 3.56 g. Na in 80 ml. MeOH gives 32 g. Et threo-2-amino-3-phenyl-3-methoxypropionate (XXII). A soln. of 32 g. XXII in 100 cc. abs. Et<sub>2</sub>O treated with 8 g. LiAlH<sub>4</sub> in 300 ml. abs. Et<sub>2</sub>O gives 25.76 g. threo-1-phenyl-1-methoxy-2-amino-3-hydroxypropane (XXIII) as an oil; *N*-*p*-nitrobenzoyl deriv., m. 176-81°. Treatment of 0.08 g. XXIII with 0.8 ml. 60% aq. HBr followed by 0.63 g. *p*-O<sub>2</sub>NCH<sub>2</sub>COCl gives 0.02 g. "threo-1-phenyl-2-amino-1,3-dihydroxypropane bis-*p*-nitrobenzoate" (XXIV), m. and mixed m.p. 196-8°. A soln. of 19.39 g. XXIII in 35 ml. abs. pyridine treated with 90 ml. Ac<sub>2</sub>O gives 23.88 g. threo-1-phenyl-1-methoxy-2-acetamido-3-acetoxypropane (XXV), m. 122-3°. To a mixt. of 4.8 ml. concd. HNO<sub>3</sub> and 40 ml. concd. H<sub>2</sub>SO<sub>4</sub> at -10 is added a soln. of 23.38 g. XXV in 75 ml. CHCl<sub>3</sub>, giving 80.59 g. of oil which heated 2 hrs. with 250 ml. 6% HCl, extd. with CHCl<sub>3</sub>, the

solvent removed, and the residue treated with 10.1 g. BrOH gives 17.93 g. benzoic acid salt of threo-1-*p*-nitrophenyl-1-methoxy-2-amino-3-hydroxypropane (XXVI), m. 91-7° (from abs. alc.). Treating 12.5 g. XXVI with 76 ml. *N* NaOH gives 0.63 g. of the free base (XXVII), m. 82-4° (from H<sub>2</sub>O). Heating 0.52 g. XXVII with 5.2 ml. 54% HBr gives, on addn. of 10*N* NaOH, a good yield of threo-1-*p*-nitrophenyl-2-amino-1,3-dihydroxypropane (XXVIII), m. and mixed m.p. 141-2°. Heating 2.63 g. XII with 11 ml. 54% HBr and heating the resulting hydrobromide with 60 ml. H<sub>2</sub>O gives 1.12 g. of the demethylated base. A soln. of 0.63 g. of this base in 3 ml. abs. alc. treated with 0.40 g. BrOH gives 0.35 g. of mixed salts. Recrystn. of 0.3 g. of this product from 10 ml. abs. alc. gives 0.09 g. of XVI benzoic acid salt, m. 150-61°, and 0.14 g. of erythro-1-phenyl-2-amino-1,3-dihydroxypropane (XXIX) benzoic acid salt, m. 206-8°. Heating XXVIII or erythro-1-*p*-nitrophenyl-2-amino-1,3-dihydroxypropane (XXX) with HBr produces no change in configuration. Heating 0.5 g. XXX.HCl with 5 ml. concd. HCl in a sealed tube at 100° gives 0.37 g. of oil which, dissolved in 1 ml. abs. alc. and treated with 0.27 g. BrOH, gives 0.39 g. of XVI benzoic acid salt, m. 163-3°. Heating XVI with HBr produces no change in configuration. A soln. of 1.4 g. threo-1-phenyl-1-hydroxy-2-acetamido-3-acetoxypropane (XXI) in 70 ml. dry Me<sub>2</sub>CO treated with 14 g. Ag<sub>2</sub>O and 14 ml. MeI gives, when the process is repeated, 0.35 g. XXV, m. 118-20°, b.p. 140-50°. Boiling 4.62 g. XXVII with 7.52 g. *D*-[C<sub>11</sub>(OH)<sub>2</sub>CO<sub>2</sub>H]<sub>2</sub> in 20 ml. abs. alc. gives, on fractional crystn. from abs. alc. 2.4 g. (+)-threo-1-*p*-nitrophenyl-1-methoxy-3-amino-3-hydroxypropane dibenzoyl-*D*-tartrate, C<sub>24</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub> (XXXII), m. 194-6° (ald -44° (1% soln. in 60% alc.)). A soln. of 2.25 g. XXXII

JAMES HILL, NITC H

in 20 ml. H<sub>2</sub>O treated with 5 ml. 2N NaOH gives 0.78 g. 1(+)-threo-1-p-nitrophenyl-1-methoxy-2-amino-3-hydroxypropane (XXXIII), m. 69° (from C<sub>6</sub>H<sub>6</sub>), [α]<sub>D</sub> 68 (1% soln. in N HCl). In a similar manner D(-)-threo-1-p-nitrophenyl-1-methoxy-2-amino-3-hydroxypropane (XXXIV) is prep., m. 104-7° (from C<sub>6</sub>H<sub>6</sub> and H<sub>2</sub>O), [α]<sub>D</sub> -74° (1% soln. N HCl). Heating 0.49 g. XXXIV with 5 ml. 53.8% HBr for 1 hr. followed by addn. of 10 ml. H<sub>2</sub>O and further heating under N gives 0.06 g. D(-)-threo-1-p-nitrophenyl-2-amino-1,3-dihydroxypropane (XXXV), m. and mixed m.p. 104-5° [α]<sub>D</sub> -29° (2% soln., N HCl). Heating 0.6 g. XXXIII with 6 ml. 50% HBr followed by addn. of 12 ml. H<sub>2</sub>O and further heating under N gives 0.07 g. 1(+)-threo-1-p-nitrophenyl-2-amino-1,3-dihydroxypropane (XXXVI), m. and mixed m.p. 143-5° (from H<sub>2</sub>O), [α]<sub>D</sub> 29° (2% soln., N HCl). Heating a soln. of 2.12 g. XXXV in 10 ml. abs. dioxane with 1.36 ml. Cl<sub>2</sub>COCHCl<sub>2</sub> gives good yield of chloramphenicol, m. and mixed m.p. 151-2°, [α]<sub>D</sub> 19° (4.9% soln., etc.).

Henry B. Hastie

CH New syntheses of chloramphenicol and its stereochemical relationships. J. Kollonitsch, A. Hais, V. Gábor, and M. Kraut (Zorschungsinst. Pharm. Ind., Budapest, Hungary). *Chem. Ber.* 10, 458-61 (1954) (in German); cf. preceding abstr. -- The *threo* form of  $\beta$ -phenylserinol 3-Me ether (I) (*N*-*p*-nitrobenzoyl deriv., m. 170-81°) was obtained by LiAlH<sub>4</sub> reduction of the Et ester of the diastereoisomer of  $\beta$ -phenylserine Me ether (II) with the lower m.p. and by reduction of the phthalyl deriv. of II to 3-phenyl-3-methoxy-2-phthalimidopropionaldehyde, followed by reduction with (iso-PrO)<sub>2</sub>Al and dephthalation with N<sub>2</sub>H<sub>4</sub>. From the *O,N*-di-Ac deriv. of I was derived  $\beta$ -*p*-nitrophenylserinol 3-Me ether (III), m. 82-4°, which was demethylated to *threo*-1-(*p*-nitrophenyl)-2-amino-1,3-dihydroxypropane (IV). Treatment of III with tartaric acid or dibenzoyltartaric acid produced the optical antipodes. The *l*-isomer of III, m. 105-7°, [ $\alpha$ ]<sub>D</sub> -74° (1% in *N* HCl), was converted by demethylation to a compd. (V) apparently identical with the hydrolyzate of natural chloramphenicol (VI). Treatment of V with CHCl<sub>3</sub>/COCCl<sub>3</sub> gave a good yield of VI. The diastereoisomer of II with the higher m.p. was similarly reduced to obtain *erythro*- $\beta$ -phenylserinol 3-Me ether (VII) (*N*-*p*-nitrobenzoyl deriv., m. 163-4°), which was converted to *erythro*- $\beta$ -*p*-nitrophenylserinol 3-Me ether, m. 110-11°. Demethylation of VII with aq. HBr resulted primarily in *erythro*- $\beta$ -phenylserinol (VIII), with some *threo*- $\beta$ -phenylserinol (IX). It was found that the conversion of

VIII to IX could be effected under the conditions of methylation. However IX, *erythro*- $\beta$ -*p*-nitrophenylserinol, was converted to *threo*- $\beta$ -*p*-nitrophenylserinol (X) under these conditions. *trans*-Cinnamyl ac. Me ether was reduced in EtOH with Br in the presence of PbO, yielding 1-*p*-bromo-1,3-dimethoxypropane (XI), which was converted by ammonolysis to  $\beta$ -phenylserinol di-Me ether (XII) (*N*-*p*-nitrobenzoyl deriv., m. 129-30°). The *N*-Ac deriv. (XIII) was identical with the compd. obtained from the *N*-Ac deriv. of *threo*- $\beta$ -phenylserinol by methylation with MeI and NaOH. XIII was nitrated, deacetylated, and demethylated to give X. From the results it is evident that ammonolysis of 3-phenyl-3-methoxy-2-bromopropionic acid (XIV) and XI gives diastereoisomeric amino deriva. although XI and XIV probably have the same configuration. It is suggested that this apparent contradiction can be explained by the "neighboring group effect."

✓ 18. Studies on chloramphenicol, II. Synthesis of 1-phenyl-3-amino-propane-1,2-diol derivatives. (In German) J. KOL-  
 IONIKICH, A. HALAS, M. KRANT, V. GABOR.  
 Acta Chimica Academiae Scientiarum Hungaricae, Vol. 6,  
 1955, No. 3-4, pp. 381-395, 2 figs.

*Chem*

The attempted synthesis of chloramphenicol starting from cinnamic alcohol and its derivatives led to the isomeric 1-*p*-nitrophenyl-3-dichloroacetamidopropane-1,2-diol compound instead. To obtain the suitable bromo-methylates the dibromo derivatives of *p*-nitro-cinnamic alcohol and its trityl ether were prepared as the first stage however upon treatment with sodium methoxide these compounds yielded unsaturated bromine derivatives instead of the desired compounds. Therefore a new method was elaborated which essentially consists in the addition of the elements of methyl hypobromite to the reaction mixture in the presence of yellow lead oxide. Aminoanalysis of the trityl derivatives of the bromo-methylates obtained in this way yielded only the corresponding enol-ethers. The 3-phthalimido derivatives were produced by fusing the bromo-methylate derivatives containing a free hydroxyl group with phthalimide potassium. Similar results were attained by treating the acyl derivatives in the same way. The compound 1-*p*-nitrophenyl-3-amino-propane-1,2-diol was prepared by way of demethylation of the corresponding deacylated compound. The structure of this amino-propane-diol derivative was proved by the periodate oxidation of its *N-p*-nitrobenzoate derivative. The chloramphenicol isomeride obtained by the dichloroacetylation of the 1-*p*-nitrophenyl-3-amino-propane-1,2-diol compound showed no bacteriostatic activity.

XVII (20.1 g.), 50 ml. of *p*-pyridine and 20 ml. CHCl<sub>3</sub> mixed with 17.1 g. XIa with ice-cooling, the mixt. kept overnight at room temp., the CHCl<sub>3</sub> evapd., the residue treated with ice H<sub>2</sub>O, and the crystals washed with EtOH and recrystd. from abs. EtOH gave 24.2 g. PhCH(OMe)-CHBr-CH(O,CCaI,NO<sub>2</sub>-*p*) (XVIII), m. 100°. XVIII (20 g.) and 7.4 g. VIIIa stirred at 170° and the mixt. extd. with H<sub>2</sub>O and crystd. from abs. EtOH gave 7.6 g. PhCH(OMe)-CH(O,CCaI,NO<sub>2</sub>-*p*)-CH<sub>2</sub>N(CO<sub>2</sub>CH<sub>3</sub>) (XIX), m. 164-5°. XIX (9.1 g.) reduced with 20 ml. abs. EtOH and 20 ml. *N*-Et<sub>3</sub>N, H<sub>2</sub>O, the EtOH evapd., and the residue worked up yielded 3.42 g. PhCH(OMe)CH(OH)CH<sub>2</sub>HOCCaI,NO<sub>2</sub>-*p*, m. 140-1° (from C<sub>2</sub>H<sub>6</sub>). MeCOCl (5.4 g.) dropped into 6.7 g. IIa, 0.1 g. cryst. H<sub>2</sub>SO<sub>4</sub>, and 50 ml. abs. Et<sub>2</sub>O, at 10-15°, the mixt. refrigerated overnight and evapd. in *vacuo*, and the residue dried to const. wt. and distd. at 110°/1 mm. gave 5 g. PhCCH:CHCH<sub>2</sub>OH. XVII (20 g.) in 60 ml. abs. pyridine treated with 25 g. ClCPh, gave 22.04 g. Ph-CH(OMe)CHBrCH<sub>2</sub>OCPh (XX), m. 110-12° (from EtOH). XX (1 g.) heated with 15 ml. NH<sub>3</sub> in a sealed tube at 80° failed to remove Br, but heating 5 g. XX, 2 g. KOH, and 50 ml. abs. EtOH 7 hrs. at 160°, evapd. the mixt., and ext. the mixt. with H<sub>2</sub>O gave PhC(OMe)CHCH<sub>2</sub>OCPh, m. 139-42° (from EtOH); further heating with NH<sub>2</sub>-Na at 120° in a sealed tube failed to split out MeO. PhCH(OMe)CHCH<sub>2</sub>OH (17.5 g.) (from IIa and Ph<sub>2</sub>O-iodine) in 30 ml. abs. pyridine let stand overnight with 17.4 g. ClC-Ph, the mixt. treated with ice H<sub>2</sub>O, and the product (33.2 g.) recrystd. from EtOH gave 16.5 g. PhCH(OMe)CHCH<sub>2</sub>O-CPh, m. 141-5°; heating this with 10% NH<sub>3</sub>-EtOH in a sealed tube failed to remove the iodine. J. Ev. M.

GABOR, V.

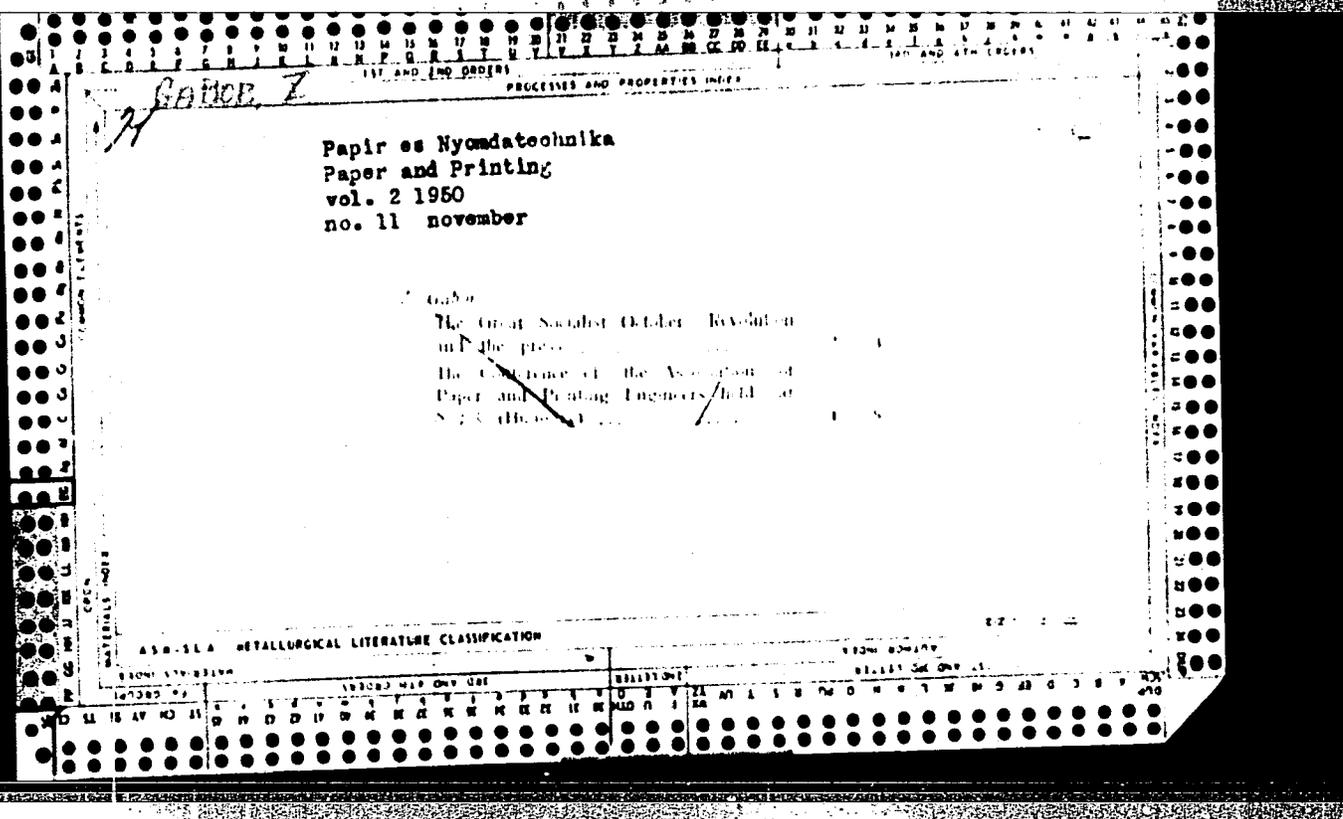

New methods for the synthesis of peptides. J. Kolb-  
nitsch, V. Gábor, and A. Hajós (Research Inst. Pharma-  
ceutical Ind., Rottenbiller, Budapest). *Nature* 177, 841-2  
(1956).—The PhCS (I) group is used for the protection of  
the amino groups of amino acids. It is then split off from  
the N-PhCS peptide derivs. by oxidative methods. Oxida-  
tion is carried out with 2.5 moles  $BzO_2H$  at  $-5^\circ$  in  $AcOH$ .  
 $C_6H_5$ ,  $C_6H_5$ -tetrahydrofuran, dioxane, or dioxane contg. pre-  
ferably 2% water. The products of oxidation probably  
represent a type of mixed anhydrides of carbanic acids with  
sulfonic acids hitherto unknown. With water this type of  
compd. disintegrates immediately with the evolution of  
 $CO_2$ , and the corresponding peptides or amino acids are iso-  
lated in excellent yield by absorption on a Dowex 50  
cation-exchange resin and elution with dil.  $NH_3$ . Peptides  
were also prepd. using MeCS amino acids. With  $PhCH_2$ -  
 $COCl$  however, the amino acids and peptides were smoothly  
acylated. The syntheses of a no. of peptides is discussed.

Chloramphenicol. IV. New synthesis of chloramphenicol. V.  
Gábor, J. Kollonitsch and A. Hajós (*Acta chim. hung.*, 1958, 10, 239-244). --trans-Cianamic alcohol methyl ether is treated in methanol with  $PbO_2$  and Br to give erythro-2-bromo-1 : 3-dimethoxy-1-phenylpropane. Ammonolysis gives threo-2-amino-1 : 3-dimethoxy-1-phenylpropane, whose structure is confirmed by its identity with the product obtained by methylating the corresponding dihydroxy compound. Acetylation, nitration and deacetylation give the  $\beta$ -nitro derivative, which can be resolved into optical isomers with dibenzoyltartaric acid. Demethylation of the base with  $HBr$  gives threo-2-amino-1 : 3-dihydroxy-1- $\beta$ -nitrophenylpropane which can be dichloroacetylated with Et 1 : 1-dichloro- or 1 : 1 : 3 : 3-tetrachloro-acetoacetate to give chloramphenicol.

Title : Contribution to a Study of the Metric of Space in the Theory of Relativity

Orig Pub : Kolozsvari egyet. kozl. Termeszettud. sor., 1957, 2, No 1-2, 59-67

Abstract : The author investigates weak interaction of two gravitating masses in the absence of external gravitational fields. An expression is obtained for the displacement of the perihelion of mercury, which agrees with the ordinary expression. It is stated that the gravitational field consists of a field of the electric type and a field of magnetic type, and the identification of the gravitational field of the magnetic type with the intrinsic magnetic field of celestial bodies being considered

lacking of any foundation, in the author's opinion. It is concluded from this that Blackett (Blackett, P.M.S., Nautre, 1947, 159, 658) did not discover the origin of stellar magnetism, but the gravitational moment of celestial bodies. It is shown that the mass of a material point in a weak gravitational field depends not only on its velocity, but also on the gravitational potential. -- A.Ya. Terkin

"Reaction of Disulfur Dichloride and Sulfur Dichloride with Cyanide; Their Determination through Thiocyanate" 15  
BT 1

Budapest, Acta Chimica Academiae Scientiarum Hungaricae, Vol 47, No 2, 1966, pp 129-136.

Abstract: [English article] In the reaction of disulfur dichloride with cyanide, thiocyanogen forms first. The product then oxidizes the excess cyanide to paracyanogen by transforming into thiocyanate. The reaction of sulfur dichloride proceeds in a similar manner. The findings were utilized in the development of an analytical technique for the determination of disulfur dichloride and sulfur dichloride by determining the amount of thiocyanate formed. This latter determination is accomplished by iodometry.

"Investigation of Some Physiological Relations in Grass Grown for  
Seed."

Bratislava, Biologia, Vol 21, No 7, 1966, pp 493 - 502

Abstract: Mechanical properties of seed grasses grown at the sta-  
tion at Levočske Luky were investigated. The following grasses  
were studied: Phleum pratense, Festuca rubra, Festuca pratensis,  
Arrhenatherum elatius, Trisetum flavescens, Poa pratensis, Poa  
palustris, Alopecurus pratensis, Agrostis stolonifera, and Lolium  
perenne. The yield of leaves, the relationship between leaves,  
and stems, and the chlorophyll content of the grasses are discus-  
sed. Dry matter consists mainly of dried grass leaves. 1 Figure,

Influence of cobalt chloride on peripheral blood of dogs. M. Nikš and J. Gáborik (Komenského Univ., Bratislava, Czech.). *Bratislav. Lekárske Listy* 35, II, 581-97 (1955).—  
 11) Dogs fed with daily doses of 2 mg. and 4 mg. CoCl<sub>2</sub> per kg. of body wt. for 8 weeks showed gradual increase in the values of the red blood component, reaching max. towards the end. On the 20th day a significant reticulosis (I) occurred (av. increase of 800%) which was followed by an increase of the erythrocyte count (II) by 23.5% on the av. On simultaneous administration of Fe the amt. of hemoglobin (III) increased also (by 13.8%). The amt. of circulating blood increased by 10.6 ml./kg. of wt. The hematocrit value of erythrocytes increased by 5.6 points, the viscosity of blood rose from 4.3 to 5.6. Slight microcytosis and a tendency towards hypochromia was observed in these dogs. In a group receiving 2 mg. CoCl<sub>2</sub>/kg. intravenously the increase of I and II was less significant (by 100% and 13.4% resp.) but a significant rise was observed in the amt. of III

(by 25%) and the erythrocytes showed tendency towards hyperchromia. Intravenous application of CoCl<sub>2</sub> produced unfavorable symptoms: increase of the pulse rate, acceleration and deepening of respiration, nausea, vomiting and sometimes collapse. Neither peroral nor intravenous administration of CoCl<sub>2</sub> effected any changes in the no. and the differential count of leucocytes, nor in the body wt. of the animals. Another group receiving 10-20 γ vitamin B<sub>12</sub>/kg. subcutaneously for 2 weeks did not reveal any significant changes in the compn. of peripheral blood. Peroral administration of daily doses of 2 mg. CoCl<sub>2</sub>/kg. was found suitable for exptl. production of polycythemia in dogs caused by neoformation of erythrocytes (IV). Intravenous application is not recommended for its smaller effect on IV and because of the untoward effects and the danger of toxicity. L. J. Urbánek

Gaborik, J.

✓ Regeneration of erythrocytes under the influence of  
cobalt salts. M. Nikš and J. Gáborik (Komenský Univ.,  
Bratislava, Czech.). ~~Bratislava~~ ~~Lékařské~~ ~~časopis~~ 39, 203-15  
(1956).—In dogs that had been given per os 3 mg. CoCl<sub>2</sub>/kg.  
a day for several weeks prior to acute bleeding, the erythro-  
cytes recovered the initial values by 10-14 days earlier than  
in control animals. Histopathol. examm. revealed that  
long-term administration of Co did not cause any changes in  
the liver, spleen, pancreas, kidneys, lungs, myocardia, or  
bone marrow. Oral application of 100 mg. CoCl<sub>2</sub> daily to  
anemic patients was partly successful; however, the mecha-  
nism of the effect has not yet been elucidated and requires  
further exptl. work.

779. **CONDITIONED-REFLEX CHANGES IN THE PERIPHERAL BLOOD PICTURE AFTER SHAM ELECTROSHOCK** - Podmienoreflexné zmeny v morfológickom zložení periférnej krvi po imitácii elektrošoku - Nikš M. and Gáborík J. Úst. pre Všeob. a Exp. Patol. Lek. Fak., Univ. Komenského, Bratislava - BRATISL. LEK.LISTY 1958, 38/3 (136-144) Graphs 9 Tables 2

An increase of the erythrocyte count by an average of 9.6% ( $P > 0.05$ ) with a reticulocyte reaction was observed 15 min. after electroshock in dogs. The white count showed neutrophil leucocytosis with a shift to the left (increase 32.4%;  $P > 0.001$ ) which was most marked 3 hr. after the shock. After 10 electroshocks had been applied, imitation of the procedure was sufficient to cause these blood changes. Participation of the higher levels of the CNS in the reaction is supported by the fact that the conditioned reflex for the blood-cell reaction was extinguished after a certain time with isolated action of the complex conditioned stimulus. De-differentiation of the conditioned stimulus (arrangement of the experiment) was successful in one dog.

TOPIC TAGS: analytic chemistry, thionyl chloride, sulfur compound, chloride

ABSTRACT: Thionyl chloride, sulfur<sup>27</sup>yl chloride, and disulfur dichloride were determined in technical-grade thionyl chloride by hydrolyzing the ingredients in an alkaline medium in the presence of cyanide ions to sulfites, sulfates, and thiocyanate, respectively, followed by the analytical determination of the products according to standard techniques. The procedures involved in the determination were described and numerical results were presented to illustrate the accuracy of the method. Orig. art. has: 1 figure, 2 tables.

Purification of industrial sugar solutions by ion exchange carried out on the ammonium cycle. S. Vajna and [Mrs.] B. Gabos (*Cukoripari Kutatásindózet Közleményei* [Suppl. to *Cukoripari*], 1954, 1, 38-50).—Pilot plant tests were made of molasses purification using a cation-exchanger  $\text{NH}_4^+$  and an anion-exchanger  $\text{OH}^-$ . The  $\text{NH}_4^+$  in the purified liquor is removed by boiling; the purity is raised from 60 to 80. Residual impurities: betaine, amino-acids, and Ca are removed by further treatment with an acid cation-exchanger and a weak anion-exchanger and the purity reaches 98. The regeneration of the ammonium cycle exchangers is described. Analytical data are given in tables and graphs, costs are considered and the literature is surveyed. (109 references, 144 patents.)

98. Batch process for the purification of beet juice.  
S. Vajna, B. Gabos. *Cukoripari Kutatásintézet Köz-  
leményei*, Vol. 2, 1955, No. 2, pp. 80-83, 1 fig., 2 tabs.

Based on experimental findings it was established that not only the pH range between 10.8 and 11 was suitable for the preclarification process but a pH optimum existed for this procedure about 1 to 1.5 pH below the above stated values. In order to secure filtration calcium carbonate mud prepared separately was added simultaneously to the juice during the coagulation of the colloids. The quantity of this mud was generally less than that currently produced during the primary carbonation of juices. The carbonation juice thus obtained was heated to boiling temperature in order to aggregate the well coagulated colloids. The calcium carbonate employed was produced either by processing the regenerating solutions obtained during the ion exchange procedure carried out in ammonia cycle or by the common carbonation of the thin juice. The speed of filtration with these clarified juices was 2 to 3 times greater than those encountered during industrial operations currently employed. The composition of these juices was found to be identical with that of the Silin juices.
